Speciality Flexibles

We are one of the largest extruders of Poly films made of LD, HM, LLDPE resins. We manufacture LD films for Shrink Packaging for Bundling & Collation applications for both transit and retail usage.

We also offer Surface Printed Multilayer Extruded Films for Bulk Commodities, Health & Hygiene, Homecare and Food Packaging applications.

Shrink Packaging Films

Kris offers Shrink-LD Packaging Film for Bundle Collation and Retail Display Collation Packing. The offering includes Mono/Multi-Layer or Printed / Plain Films. This film finds application in industries like Food & Beverages, Pharmaceutical, FMCG, Health Care where the end product needs to be bundle packed.

Multilayer Shrink film is a type of secondary packaging used to bundle objects together by heat shrinking a film around the objects. Collation Shrink Film is stretched during its production. This stretched Shrink Film is wrapped around the object (can, box, bottle, etc.) and heated in a shrink oven. The film collapses around the goods and holds the single pack together. Multi-packing is the faster, more economical cousin to shrink bundling, and is a great option for quantity-limited retail promotions.

Hygiene Packaging Films

KFPL offers Multi-layer co-extruded films that involve packaging material for packaging of Health & Hygiene Products like Baby Diapers, Adult Incontinence and Female Hygiene Products. Hygiene Packaging Films are Multi-layer co-extruded structures that are Surface printed using the CI Flexo printing technology.

KFPL Hygiene Packaging Films are available as preformed bags and in Roll form.

Bulk Packaging Films

KFPL offers Multi-layer Co-extruded PE films that find application in Bulk Packaging of Commodities like Cereals, Flour, Rice, etc and other bulk packaged products.

Bulk Packaging Films provide the needed protection of the products, avoiding spillage, spoilage and infestation.
